Experiment (7)

Three component system

Types of liquides

- Miscible

Ex. $\text{H}_2\text{O} + \text{CH}_3\text{COOH}$

- Partially miscible

Ex. $\text{H}_2\text{O} + \text{Phenol}$

- Immiscible

Ex. $\text{H}_2\text{O} + \text{Oil}$

Heterogeneous → homogeneous

miscible
liquids

Homogeneous → Heterogeneous

Equatorial triangle

Procedure:

No. of flask	1	2	3	4	5
Ethyl acetate (ml)	10	8	6	4	2
Water (ml)	2	4	6	8	10
Ethanol	From burtte				

Heterogeneous \longrightarrow homogeneous

Calculation

- Calculate the percentage composition by weight of each mixture.

$$\% \text{ by weight} = (\text{wt of substance} / \text{Total weight}) \times 100$$

Density of ethyl acetate = 0.894

Density of ethanol = 0.789

Density of water = 0.996

Flask 1

1. % by weight ethyl acetate

$$= (v_1 d_1 / (v_1 d_1 + v_2 d_2 + v_3 d_3)) \times 100$$

Ex. $(10 \times 0.894 / (10 \times 0.894 + 2 \times 0.996 + \text{burttte} \times 0.789)) \times 100 = \dots\dots\%$

2. % by weight water

$$= (v_2 d_2 / (v_1 d_1 + v_2 d_2 + v_3 d_3)) \times 100$$

3. % by weight ethanol

$$= (v_3 d_3 / (v_1 d_1 + v_2 d_2 + v_3 d_3)) \times 100$$
