

**SIGNALS AND SYSTEMS USING MATLAB**  
**Chapter 5— Frequency Analysis: The Fourier Transform**

Luis F. Chaparro

## From the Fourier Series to the Fourier Transform

Aperiodic signal  $x(t)$  can be thought of as periodic signal  $\tilde{x}(t)$  with infinite fundamental period. From Fourier series of  $\tilde{x}(t)$  and limiting process we obtain Fourier transform pair

$$x(t) \quad \Leftrightarrow \quad X(\Omega)$$

$x(t)$  is transformed into  $X(\Omega)$  in the frequency-domain by the

Fourier transform: 
$$X(\Omega) = \int_{-\infty}^{\infty} x(t) e^{-j\Omega t} dt$$

while  $X(\Omega)$  is transformed into  $x(t)$  in the time-domain by the

Inverse Fourier Transform: 
$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\Omega) e^{j\Omega t} d\Omega$$

# Existence of the Fourier Transform

- For  $X(\Omega)$  to exist,  $x(t)$  must be *absolutely integrable*

$$|X(\Omega)| \leq \int_{-\infty}^{\infty} |x(t)e^{-j\Omega t}| dt = \int_{-\infty}^{\infty} |x(t)| dt < \infty$$

- ROC of  $X(s) = \mathcal{L}[x(t)]$  contains the  $j\Omega$ -axis then

$$\begin{aligned} \mathcal{F}[x(t)] &= \mathcal{L}[x(t)]|_{s=j\Omega} = \int_{-\infty}^{\infty} x(t)e^{-j\Omega t} dt \\ &= X(s)|_{s=j\Omega} \end{aligned}$$

- Duality between time and frequency allows computation of Fourier transforms

Example: Fourier transform from Laplace transform

$$(a) \quad x_1(t) = u(t), \quad X_1(s) = \frac{1}{s}, \quad \text{ROC} : \sigma > 0, \quad j\Omega\text{-axis not included}$$

$X(\Omega)$  cannot be obtained

$$(b) \quad x_2(t) = e^{-2t}u(t), \quad X_2(s) = \frac{1}{s+2}, \quad \text{ROC} : \sigma > -2$$
$$X_2(\Omega) = \frac{1}{s+2} \Big|_{s=j\Omega} = \frac{1}{j\Omega+2}$$

$$(c) \quad x_3(t) = e^{-|t|}, \quad X_3(s) = \frac{1}{s+1} + \frac{1}{-s+1}, \quad \text{ROC} : -1 < \sigma < 1$$
$$X_3(\Omega) = X_3(s) \Big|_{s=j\Omega} = \frac{2}{1-(j\Omega)^2} = \frac{2}{1+\Omega^2}$$

# Inverse proportionality of time and frequency

Support of  $X(\Omega)$  is inversely proportional to the support of  $x(t)$

If  $x(t)$  has a Fourier transform  $X(\Omega)$  and  $\alpha \neq 0$  is a real number, then  $x(\alpha t)$

- is a contracted signal when  $\alpha > 1$ ;
- is a contracted and reflected signal when  $(\alpha < -1)$ ;
- is an expanded signal when  $0 < \alpha < 1$ ;
- is a reflected and expanded signal when  $-1 < \alpha < 0$ ; or
- is a reflected signal when  $\alpha = -1$

and

$$x(\alpha t) \Leftrightarrow \frac{1}{|\alpha|} X\left(\frac{\Omega}{\alpha}\right)$$

Fourier transform of pulses  $x_1(t) = u(t + 0.5) - u(t - 0.5)$ , (left) and  $x_2(t) = u(t + 2) - u(t - 2)$  (right). Notice the wider the pulse the more concentrated in frequency its Fourier transform

Example:  $x(t) = u(t) - u(t - 1)$  vs  $x_1(t) = x(2t)$

$$X(s) = \frac{1 - e^{-s}}{s}, \quad \text{ROC : whole } s\text{-plane}$$

$$X(\Omega) = \frac{e^{-j\Omega/2}(e^{j\Omega/2} - e^{-j\Omega/2})}{2j\Omega/2} = \frac{\sin(\Omega/2)}{\Omega/2} e^{-j\Omega/2} \quad \text{infinite support}$$

$$x_1(t) = x(2t) = u(2t) - u(2t - 1) = u(t) - u(t - 0.5)$$

$$X_1(\Omega) = \frac{e^{-j\Omega/4}(e^{j\Omega/4} - e^{-j\Omega/4})}{j\Omega} = \frac{1}{2} \frac{\sin(\Omega/4)}{\Omega/4} e^{-j\Omega/4} = \frac{1}{2} X(\Omega/2)$$

# Duality

$$\begin{aligned} x(t) &\Leftrightarrow X(\Omega) \\ X(t) &\Leftrightarrow 2\pi x(-\Omega) \end{aligned}$$

Example:

$$A\delta(t) \Leftrightarrow A$$

$$A \Leftrightarrow 2\pi A\delta(-\Omega) = 2\pi A\delta(\Omega)$$

Example:

$$\delta(t - \rho_0) + \delta(t + \rho_0) \Leftrightarrow e^{-j\rho_0\Omega} + e^{j\rho_0\Omega} = 2 \cos(\rho_0\Omega)$$

$$2 \cos(\rho_0 t) \Leftrightarrow 2\pi[\delta(\Omega + \rho_0) + \delta(\Omega - \rho_0)]$$

$$x(t) = \cos(\Omega_0 t) \Leftrightarrow X(\Omega) = \pi[\delta(\Omega + \Omega_0) + \delta(\Omega - \Omega_0)]$$

Duality to find Fourier transform of  $x(t) = 10\text{sinc}(0.5t)$

# Modulation

- Frequency shift:

$$\begin{aligned} x(t) &\Leftrightarrow X(\Omega) \\ x(t)e^{j\Omega_0 t} &\Leftrightarrow X(\Omega - \Omega_0) \end{aligned}$$

- Modulation:

$$\text{modulated signal } x(t) \cos(\Omega_0 t) \Leftrightarrow 0.5 [X(\Omega - \Omega_0) + X(\Omega + \Omega_0)]$$

Modulated signal  $y_1(t) = e^{-|t|} \cos(10t)$ , its magnitude and phase spectra

# Fourier transform of periodic signals

Represent periodic signal  $x(t)$ , of period  $T_0$ , by its Fourier series:

$$x(t) = \sum_k X_k e^{jk\Omega_0 t} \quad \Leftrightarrow \quad X(\Omega) = \sum_k 2\pi X_k \delta(\Omega - k\Omega_0)$$

Example: Periodic  $x(t)$  with period  $x_1(t) = r(t) - 2r(t - 0.5) + r(t - 1)$ , fundamental frequency  $\Omega_0 = 2\pi$

$$X_1(s) = \frac{1}{s^2} (1 - 2e^{-0.5s} + e^{-s}) = \frac{e^{-0.5s}}{s^2} (e^{0.5s} - 2 + e^{-0.5s})$$

Fourier coefficients :

$$X_k = \frac{1}{T_0} X_1(s)|_{s=j2\pi k} = (-1)^k \frac{\sin^2(\pi k/2)}{\pi^2 k^2}, \quad k \neq 0, \quad X_0 = 0.5$$

$$X(\Omega) = 2\pi X_0 \delta(\Omega) + \sum_{k=-\infty, \neq 0}^{\infty} 2\pi X_k \delta(\Omega - 2k\pi)$$

## Parseval's energy relation

For aperiodic signal  $x(t)$  with energy  $E_x < \infty$ :

- Energy conservation in time and frequency

$$E_x = \int_{-\infty}^{\infty} |x(t)|^2 dt = \frac{1}{2\pi} \int_{-\infty}^{\infty} |X(\Omega)|^2 d\Omega$$

- $|X(\Omega)|^2$  energy density: energy at each of the frequencies  $\Omega$ . Plot  $|X(\Omega)|^2$  vs  $\Omega$  is called the **energy spectrum** of  $x(t)$ , and displays how the energy of the signal is distributed over frequency

Example: Impulse  $x(t) = \delta(t)$  is not finite energy signal

$$X(\Omega) = \mathcal{F}[\delta(t)] = 1$$

$$E_x = \frac{1}{2\pi} \int_{-\infty}^{\infty} |X(\Omega)|^2 d\Omega \rightarrow \infty$$

# Symmetry of spectral representations

- $x(t)$  real-valued signal

$$X(\Omega) = \mathcal{F}[x(t)] = |X(\Omega)|e^{j\angle X(\Omega)} = \mathcal{R}e[X(\Omega)] + j\mathcal{I}m[X(\Omega)]$$

$$|X(\Omega)| = |X(-\Omega)|, \quad \mathcal{R}e[X(\Omega)] = \mathcal{R}e[X(-\Omega)] \quad (\text{even functions of } \Omega)$$

$$\angle X(\Omega) = -\angle X(-\Omega), \quad \mathcal{I}m[X(\Omega)] = -\mathcal{I}m[X(-\Omega)] \quad (\text{odd functions of } \Omega)$$

- Spectra

$ X(\Omega) $ vs $\Omega$	Magnitude Spectrum
$\angle X(\Omega)$ vs $\Omega$	Phase Spectrum
$ X(\Omega) ^2$ vs $\Omega$	Energy/Power Spectrum.

Example:

$$(a) \quad x_1(t) = u(t) - u(t - 1), \quad \text{let } z(t) = x_1(t + 0.5)$$

$$Z(\Omega) = \frac{\sin(\Omega/2)}{\Omega/2} \quad (\text{real})$$

$$X_1(\Omega) = e^{-j0.5\Omega} Z(\Omega)$$

$$|X_1(\Omega)| = \left| \frac{\sin(\Omega/2)}{\Omega/2} \right|$$

$$\angle X_1(\Omega) = \angle Z(\Omega) - 0.5\Omega = \begin{cases} -0.5\Omega & Z(\Omega) \geq 0 \\ \pm\pi - 0.5\Omega & Z(\Omega) < 0 \end{cases}$$

$$(b) \quad x_2(t) = e^{-t}u(t), \quad X_2(\Omega) = \frac{1}{1 + j\Omega}$$

$$|X_2(\Omega)| = \frac{1}{\sqrt{1+\Omega^2}}, \quad \angle(X_2(\Omega)) = -\tan^{-1} \Omega,$$

Pulse  $x_1(t) = u(t) - u(t - 1)$  and its magnitude and phase spectra.

# Convolution and filtering

- Input  $x(t)$  (periodic or aperiodic) of stable LTI system has Fourier transform  $X(\Omega)$  system has frequency response  $H(j\Omega) = \mathcal{F}[h(t)]$ ,  $h(t)$  impulse response output is convolution integral  $y(t) = (x * h)(t)$ , with Fourier transform

$$Y(\Omega) = X(\Omega) H(j\Omega)$$

- If input  $x(t)$  is periodic the output is also periodic of the same fundamental period, and with Fourier transform

$$Y(\Omega) = \sum_{k=-\infty}^{\infty} 2\pi X_k H(jk \Omega_0) \delta(\Omega - k\Omega_0)$$

where  $\{X_k\}$  are the Fourier series coefficients of  $x(t)$  and  $\Omega_0$  its fundamental frequency.

## Example: Windowing

rectangular window  $w(t) = u(t + \Delta) - u(t - \Delta)$ ,  $\Delta > 0$

windowed signal  $y(t) = w(t)x(t)$

$$y(t) = w(t) \underbrace{\frac{1}{2\pi} \int_{-\infty}^{\infty} X(\rho) e^{j\rho t} d\rho}_{x(t)} = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\rho) w(t) e^{j\rho t} d\rho$$

$$Y(\Omega) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\rho) \mathcal{F}[w(t) e^{j\rho t}] d\rho = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\rho) W(\Omega - \rho) d\rho$$

$$y(t) = x(t)w(t) \Leftrightarrow \frac{1}{2\pi} \text{convolution of } X(\Omega) \text{ and } W(\Omega) = \frac{2 \sin(\Omega\Delta)}{\Omega}$$

# Ideal filtering

Filtering: to pass desired frequency component and to attenuate undesirable components

*Ideal filters: (top-left clockwise) low-pass, band-pass, band-eliminating and high-pass*

Issues with ideal filters:

- Non-causal
- Paley-Wiener integral condition causal and stable filter with frequency response  $H(j\Omega)$  should satisfy small

$$\int_{-\infty}^{\infty} \frac{|\log(H(j\Omega))|}{1 + \Omega^2} d\Omega < \infty$$

Example: **Gibb's phenomenon**

Passing  $x(t)$  through ideal low-pass filter

$$H(j\Omega) = \begin{cases} 1 & -\Omega_c \leq \Omega \leq \Omega_c, \quad N\Omega_0 < \Omega_c < (N+1)\Omega_0 \\ 0 & \text{otherwise} \end{cases}$$
$$X(\Omega) = \sum_{k=-\infty}^{\infty} 2\pi X_k \delta(\Omega - k\Omega_0)$$

The output of the filter with  $2N + 1$  Fourier coefficients

$$x_N(t) = \mathcal{F}^{-1}[X(\Omega)H(j\Omega)] = \mathcal{F}^{-1} \left[ \sum_{k=-N}^N 2\pi X_k \delta(\Omega - k\Omega_0) \right]$$
$$= [x * h](t), \quad h(t) \text{ sinc function}$$

Convolution around the discontinuities of  $x(t)$  causes ringing before and after them, independent of the value of  $N$

Example: RLC circuit,  $R = 1 \Omega$ ,  $L = 1 H$ , and  $C = 1 F$ , and IC zero

low-pass: output  $v_C(t)$ ,  $H_{lp}(s) = \frac{V_C(s)}{V_i(s)} = \frac{1}{s^2 + s + 1}$

high-pass: output  $v_L(t)$ ,  $H_{hp}(s) = \frac{V_L(s)}{V_i(s)} = \frac{s^2}{s^2 + s + 1}$

band-pass: output  $v_R(t)$ ,  $H_{bp}(s) = \frac{V_R(s)}{V_i(s)} = \frac{s}{s^2 + s + 1}$

band-stop: output  $v_{cL}(t)$ ,  $H_{bs}(s) = \frac{V_{cL}(s)}{V_i(s)} = \frac{s^2 + 1}{s^2 + s + 1}$

# Frequency Response from Poles and Zeros

$$G(s) = K \frac{s - z}{s - p}, \quad \text{zero } z, \text{ pole } p, \text{ gain } K \neq 0$$

Frequency response of  $G(s)$  at frequency  $\Omega_0$

$$G(j\Omega_0) = K \frac{\vec{Z}(\Omega_0)}{\vec{P}(\Omega_0)} = |K| e^{j\angle K} \frac{|\vec{Z}(\Omega_0)|}{|\vec{P}(\Omega_0)|} e^{j(\angle \vec{Z}(\Omega_0) - \angle \vec{P}(\Omega_0))}.$$

$$\text{Magnitude response } |G(j\Omega_0)| = |K| \frac{|\vec{Z}(\Omega_0)|}{|\vec{P}(\Omega_0)|}$$

$$\text{Phase response } \angle G(j\Omega_0) = \angle K + \angle \vec{Z}(\Omega_0) - \angle \vec{P}(\Omega_0)$$

Example: Frequency response of high-pass filter

$$H(s) = \frac{V_r(s)}{V_s(s)} = \frac{s}{s+1}$$

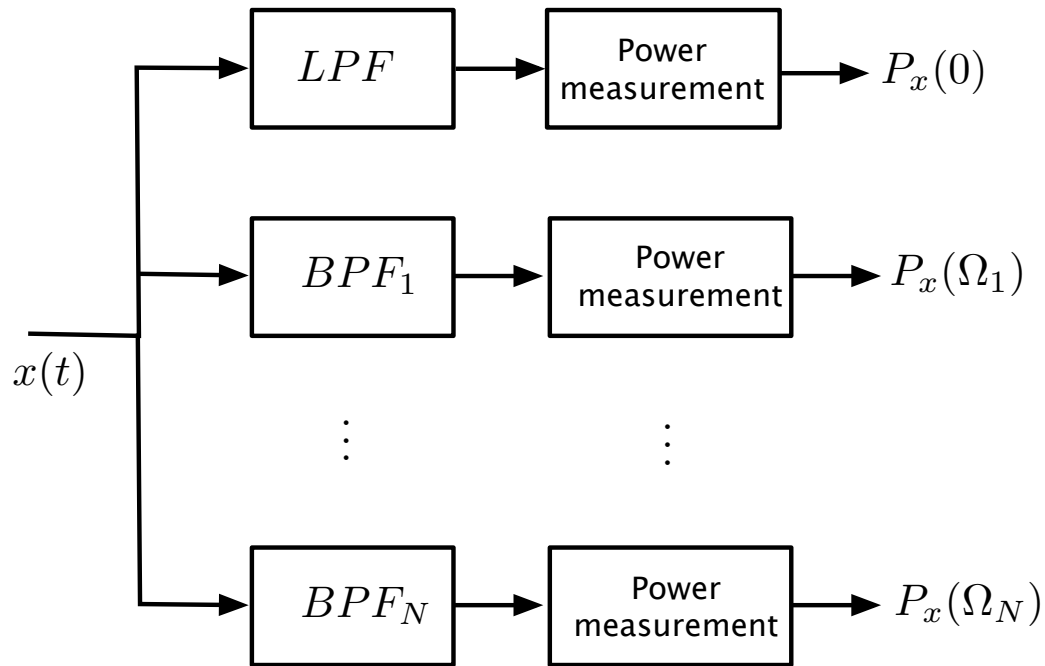

$$H(j\Omega) = \frac{j\Omega}{1+j\Omega} = \frac{\vec{Z}(\Omega)}{\vec{P}(\Omega)}$$

vector  $\vec{Z}(\Omega)$  from  $s = 0$  to  $j\Omega$

vector  $\vec{P}(\Omega)$  from  $s = -1$  to  $j\Omega$

$\Omega$	$\vec{Z}(\Omega)$	$\vec{P}(\Omega)$	$H(j\Omega) = \vec{Z}(\Omega)/\vec{P}(\Omega)$
0	$0e^{j\pi/2}$	$1e^{j0}$	$0e^{j\pi/2}$
1	$1e^{j\pi/2}$	$\sqrt{2}e^{j\pi/4}$	$0.707e^{j\pi/4}$
$\infty$	$\infty e^{j\pi/2}$	$\infty e^{j\pi/2}$	$1e^{j0}$

# Spectrum analyzer

*Bank-of-filter spectrum analyzer: the frequency response of the bank-of-filters is that of an all-pass filter covering the desired range of frequencies*

## Basic Properties of the Fourier Transform

Expansion/contraction	$x(\alpha t), \alpha \neq 0$	$\frac{1}{ \alpha } X\left(\frac{\Omega}{\alpha}\right)$
Reflection	$x(-t)$	$X(-\Omega)$
Parseval's	$E_x = \int_{-\infty}^{\infty}  x(t) ^2 dt$	$E_x = \frac{1}{2\pi} \int_{-\infty}^{\infty}  X(\Omega) ^2 d\Omega$
Duality	$X(t)$	$2\pi x(-\Omega)$
Differentiation	$\frac{d^n x(t)}{dt^n}, n \geq 1$	$(j\Omega)^n X(\Omega)$
Integration	$\int_{-\infty}^t x(t') dt'$	$\frac{X(\Omega)}{j\Omega} + \pi X(0)\delta(\Omega)$
Shifting	$x(t - \alpha), e^{j\Omega_0 t} x(t)$	$e^{-j\alpha\Omega} X(\Omega), X(\Omega - \Omega_0)$
Modulation	$x(t) \cos(\Omega_c t)$	$0.5[X(\Omega - \Omega_c) + X(\Omega + \Omega_c)]$
Periodic	$x(t) = \sum_k X_k e^{jk\Omega_0 t}$	$X(\Omega) = \sum_k 2\pi X_k \delta(\Omega - k\Omega_0)$
Symmetry	$x(t)$ real	$ X(\Omega)  =  X(-\Omega) ,$ $\angle X(\Omega) = -\angle X(-\Omega)$
Convolution	$z(t) = [x * y](t)$	$Z(\Omega) = X(\Omega) Y(\Omega)$

---

## Fourier Transform Pairs

---

$$\delta(t), \delta(t - \tau)$$

$$1, e^{-j\Omega\tau}$$

$$u(t), u(-t)$$

$$\frac{1}{j\Omega} + \pi\delta(\Omega), \frac{-1}{j\Omega} + \pi\delta(\Omega)$$

$$\text{sgn}(t) = 2[u(t) - 0.5]$$

$$\frac{2}{j\Omega}$$

$$A, Ae^{-at}u(t), a > 0$$

$$2\pi A\delta(\Omega), \frac{A}{j\Omega + a}$$

$$Ate^{-at}u(t), a > 0$$

$$\frac{A}{(j\Omega + a)^2}$$

$$e^{-a|t|}, a > 0$$

$$\frac{2a}{a^2 + \Omega^2}$$

$$\cos(\Omega_0 t), -\infty < t < \infty$$

$$\pi[\delta(\Omega - \Omega_0) + \delta(\Omega + \Omega_0)]$$

$$\sin(\Omega_0 t), -\infty < t < \infty$$

$$-j\pi[\delta(\Omega - \Omega_0) - \delta(\Omega + \Omega_0)]$$

$$p(t) = A[u(t + \tau) - u(t - \tau)],$$

$$2A\tau \frac{\sin(\Omega\tau)}{\Omega\tau}$$
