Abstract: One of the tertiary amine atoms has been protonated in the title salt, C_{36}H_{57}N_{4}{+}\cdot\text{NO}_{3}{^{-}}. The four N atoms of the macrocycle are almost coplanar (r.m.s. deviation = 0.0053 Å), a result correlated with the formation of intramolecular N-H...N and N-H...N(N,N) hydrogen bonds. With respect to this plane, the benzyl groups lie to either side; a similar arrangement pertains for the cyclohexyl rings (each with a chair conformation). Helical supramolecular chains are evident in the crystal, whereby alternating cations and anions are linked by C-H...O interactions. The chains are consolidated into supramolecular arrays in the $ab$ plane via C-H...$\pi$ contacts involving both benzene rings.
